The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Methyldopa API competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Methyldopa, also known as L-methyl-L-DOPA, is a medication used for high blood pressure. It is one of the preferred treatments for high blood pressure in pregnancy. For other types of high blood pressure including very high blood pressure resulting in symptoms other medications are typically preferred. Methyldopa is an antihypertensive drug used to treat moderate to severe hypertension, especially for the treatment of hypertension during pregnancy and renal hypertension. Despite the continuous advancement of medical technology, the probability of death due to gestational hypertension has not decreased year by year as expected, but has fluctuated up and down from time to time. The prevalence of chronic hypertension in pregnancy has been steadily increasing, and HDP remains a leading cause of maternal and fetal morbidity and mortality worldwide. In addition, as the global population continues to grow, the number of pregnant women will increase accordingly in the future, thereby driving the continued increase in clinical demand for methyldopa drugs.

The global Methyldopa API market size was estimated at USD 49.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
