### Report Overview:

The Michelson interferometer is a common configuration for optical interferometry and was invented by Albert Abraham Michelson. Using a beam splitter, a light source is split into two arms. Each of those light beams is reflected back toward the beamsplitter which then combines their amplitudes using the superposition principle. The resulting interference pattern that is not directed back toward the source is typically directed to some type of photoelectric detector or camera. For different applications of the interferometer, the two light paths can be with different lengths or incorporate optical elements or even materials under test.

The Global Michelson Interferometer Market Size was estimated at USD 89.18 million in 2023 and is projected to reach USD 109.63 million by 2029, exhibiting a CAGR of 3.50% during the forecast period.
