### Report Overview:

Micro CHP (Combined Heat and Power) systems are small-scale power generation units that produce both electricity and heat for use in buildings. These systems are also known as cogeneration systems and typically generate electricity through the combustion of natural gas, propane, or other fuels.

The heat produced during the electricity generation process is captured and used for space heating, hot water production, or other heating applications. This makes Micro CHP systems more energy-efficient than traditional power generation methods that produce electricity and waste heat separately.

Micro CHP systems can be used in residential, commercial, and they are particularly useful in situations where there is a high demand for both electricity and heat. They are also a good option for reducing energy costs and greenhouse gas emissions.

The Global Micro CHP System Market Size was estimated at USD 472.79 million in 2023 and is projected to reach USD 737.85 million by 2029, exhibiting a CAGR of 7.70% during the forecast period.
