## Abstracts

A micro cover glass is a thin sheet of glass with a tiny size. It usually has an extremely thin thickness, which allows it to minimize interference with the light path in optical applications. Generally speaking, its thickness can range from a few tenths of a millimeter to several millimeters, depending on the actual use requirements. Its shape is mostly regular sheets, such as square or round, and the surface is very flat and smooth, which is crucial for obtaining high-quality optical imaging effects, because the flat surface can ensure that light is transmitted evenly and avoid irregular refraction and reflection. Micro cover glass is mainly used for observation and detection in the microscopic field. In the field of biology, it is an indispensable part of observing specimens under a microscope. When making biological sections, covering it on the specimen on the slide can protect the specimen from external factors (such as dust, liquid evaporation, etc.), while keeping the specimen flat and providing a clear field of view for observation under a microscope. In fields such as materials science and medical testing, it is also used to cover tiny samples or detection areas, making it convenient to observe the microscopic structure, cell morphology or distribution of chemicals of samples under high-power microscopes or precision instruments, helping researchers to accurately analyze and diagnose.

The global Micro Cover Glass market size was estimated at USD 174.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
