Report Overview

Micro differential pressure sensor DPS is a sensor used to measure the difference between two pressures, usually used to measure the pressure difference between the front and rear ends of a certain equipment or component. The differential pressure transmitter has high sensitivity, accuracy, and strong overload resistance. The working principle of micro differential pressure sensors is usually based on the piezoresistive effect or piezoelectric effect. Among them, the piezoresistive micro differential pressure sensor utilizes the characteristic that the resistance value of the piezoresistive element changes with pressure, and determines the pressure difference by measuring the change in resistance value. The piezoelectric micro differential pressure sensor utilizes the piezoelectric effect of piezoelectric materials to convert the pressure difference into a charge or voltage signal for measurement. Micro differential pressure sensors are widely used in fields such as air conditioning systems, gas flow measurement, liquid level measurement, filter monitoring, and gas analysis instruments. When selecting and using micro differential pressure sensors, it is necessary to consider factors such as application requirements, measurement range, accuracy requirements, output signal type, and follow the instructions and installation requirements provided by the manufacturer.
