Abstracts

The main component of the micro-electrostatic air purifier is the electrostatic adsorption device. The micro-electrostatic adsorption device is composed of a discharge wire and a negative plate. Under the action of the high-voltage generator, the electrostatic adsorption device can generate a DC high voltage voltage of 4KV-8KV and form a strong electrostatic field inside the electrostatic adsorption device. When the indoor air passes through the electrostatic adsorption device, the particles in the air (including microorganisms) are forced to carry a positive charge and are adsorbed onto the negative plate.

The global Micro-Electrostatic Air Purifier market size was estimated at USD 652.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
