## Abstracts

Micro-emulsion metalworking fluids are liquids composed of water, oil, and surfactants, typically used in metal cutting and machining processes. Compared to traditional emulsion cutting fluids, micro-emulsion metalworking fluids feature smaller emulsion particles, forming a more stable micro-emulsion structure. Due to the fine emulsion particles, micro-emulsion fluids provide effective cooling and lubrication while reducing friction, lowering cutting temperatures, and improving surface finish quality. Additionally, their lower oil content makes them more environmentally friendly, reducing waste generation, and they are ideal for high-performance, high-precision, and clean machining applications.

The global Micro-Emulsion Metalworking Fluids market size was estimated at USD 156.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
