Report Overview

The core is one of the core components of the micro and special motor, its main function is to guide and concentrate the magnetic field, in order to improve the efficiency and performance of the motor. Iron core is usually made of high permeability materials, such as silicon steel sheet, amorphous alloy, nanocrystalline alloy, etc., these materials have good magnetic properties, can effectively reduce the hysteresis loss and eddy current loss. The design and manufacture of iron core have an important impact on the overall performance of micro and special motors. there are generally two basic type of cores: stator core and rotor cores. The stator core is stationary, and the winding around it generates a rotating magnetic field when energized; the rotor core is located in the center of the motor and rotates with the magnetic field. In some motor designs, the rotor core may be replaced by permanent magnets to form a permanent magnet synchronous motor.
