Abstracts

The micro piezoelectric pump is a new type of micro pump that uses the inverse piezoelectric effect of piezoelectric ceramics to achieve fluid drive. It does not require a traditional motor drive, but applies voltage to the piezoelectric ceramic to cause it to deform slightly, thereby driving the fluid through the pump chamber. The micro piezoelectric pump consists of a piezoelectric vibrator, a pump valve and a pump body. When AC power is applied to both ends of the piezoelectric vibrator, the piezoelectric vibrator compresses or elongates radially under the action of the electric field, causing the volume of the pump cavity to change, thereby realizing fluid transportation and is suitable for occasions requiring high-precision control.

The global Micro Piezoelectric Pump market size was estimated at USD 132.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
