Abstracts

Microsilica removal systems are specialized industrial filtration units designed to capture and eliminate microsilica particles, also known as silica fume or condensed silica fume, from exhaust streams generated during high-temperature processes such as silicon and ferrosilicon production, as well as certain refining operations. These systems typically employ a combination of electrostatic precipitators, baghouse filters, or advanced hybrid technologies to achieve high-efficiency particulate removal, often exceeding 99%, due to the extremely fine nature of microsilica (particle sizes commonly below 1 micron) and its tendency to agglomerate. The primary function is not only to mitigate environmental and occupational health hazards associated with airborne silica but also to enable the recovery of microsilica as a valuable byproduct, which is widely used as a pozzolanic additive in high-performance concrete and refractory materials, enhancing strength and durability.

The global Micro Silica Removal System market size was estimated at USD 145.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
