### Report Overview

VSATs are typically defined as a full duplex satellite ground station with a parabolic antenna that is smaller than three meters in diameter. The Micro-VSAT is typically a terminal incorporating an antenna that has the equivalent parabolic size of less than 60cm. Micro-VSAT terminals are often called 'disadvantaged terminals.' This is because small terminals are limited in data throughput, due to the effective isotropic radiated power (EIRP) limitations at a system level and due to EIRP spectral density limitations defined by the various standards for operational use over the satellite. These limitations become more severe if the terminal does not meet the sidelobe requirements of the satellite operator. The reason for these imposed limitations is clear, it is important not to illuminate adjacent satellites and interfere with other users.

The global Micro Very Small Aperture Terminal (VSAT ) market size was estimated at USD 480 million in 2023 and is projected to reach USD 1150.40 million by 2030, exhibiting a CAGR of 13.30% during the forecast period.
