Report Overview

Microalgae are tiny groups of algae whose morphology can only be discerned under a microscope. Microalgae have biostimulant and biofertilizer properties that can improve crop yields and agricultural sustainability that are not readily absorbed by conventional fertilizer crops. Biostimulants are organic materials used in fertilizers. Small amounts of biostimulants can accelerate crop development under favorable and stressful conditions. Biofertilizers containing living organisms and natural substances improve the chemical and biological properties of the soil, restore soil fertility and promote plant growth.
