Report Overview:

Biological seed treatments are a wide class of products with active ingredients, including living microbes, plant extracts, fermentation products, phytohormones, and even hard chemistry. Biological substances are applied to the seed in the form of a powder or a liquid. A uniform coating covers the entire seed. The seed is available to the beneficial ingredients when it needs them in this way. Active agents in biological seed treatment can include microbes such as fungi and bacteria, as well as plant extracts and algal extracts. Beneficial microorganisms from arbuscular mycorrhizal fungus, *Trichoderma* spp., rhizobia, and other bacteria are applied to seeds before sowing to improve germination. A crop treated with biological seed functions as a biostimulant making it stronger and more productive. The treatment increases agricultural yields while assisting plants in fending diseases and reducing biotic stress. The microorganisms that support plant growth colonize the roots and shield the crop throughout the entire growing season. The applications of microbial based biological seed treatment are diverse.

The Global Microbial Based Biological Seed Treatment Market Size was estimated at USD 1313.77 million in 2023 and is projected to reach USD 2607.06 million by 2029, exhibiting a CAGR of 12.10% during the forecast period.
