Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Microbial Biopreservatives competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of microbial-derived biopreservatives reached 25,000 tons, with an average selling price of US\$11,400 per ton and a gross profit margin of approximately 35%. Biopreservatives refer to food additives extracted from natural plants, animals, and microorganisms, or obtained using bioengineering technology, that have antioxidant and preservative effects by inhibiting or killing microorganisms, promoting food preservation, and inhibiting, eliminating, or slowing down oxidation reactions. Microbial-derived preservatives are substances with antibacterial effects produced during microbial metabolism. They primarily inhibit or kill microorganisms through antibacterial substances such as bacteriocins produced by microbial metabolism. With the development of the social economy and the improvement of residents' living standards, consumers have increasingly higher requirements for food quality and safety. Green, environmentally friendly, and safe new food preservation methods will become the mainstream development direction of the future food market. Plant-derived preservatives refer to biological preservatives naturally extracted and separated from plants. The main active substances in plant preservatives can be divided into flavonoids, polyphenols, plant essential oils, and traditional Chinese medicine extracts. However, they have disadvantages such as large dosage, short antibacterial effect, and high cost, and most preservatives are still in the research stage and have not yet been commercialized. Major animal-derived preservatives include antimicrobial peptides, propolis, and protamine, but they also have disadvantages such as incomplete understanding of their mechanisms of action, complex extraction and purification processes, and high costs. In contrast, microbial biological preservatives

have broad application prospects due to their economic simplicity, non-toxicity, safety, and lack of pollution.

The global Microbial Biopreservatives market size was estimated at USD 272.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
