Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Microbial Colony Screening System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A microbial colony screening system is a comprehensive platform that integrates automated equipment, image recognition technology, and data analysis software. It can automatically image, count, analyze, and identify the characteristics of microbial colonies on culture media. It then efficiently screens and isolates target colonies based on pre-set criteria (such as size, color, shape, and fluorescent markers). This system is widely used in fields such as biomedicine, food testing, environmental monitoring, and microbial breeding. It significantly improves the efficiency, accuracy, and reproducibility of traditional manual screening and is a key tool for modern high-throughput microbial research. The upstream industries of the microbial colony screening system mainly include precision optical components (such as high-resolution cameras and lenses), automated mechanical parts (such as robotic arms and stages), culture media and fluorescent labeling reagents, image processing chips and artificial intelligence algorithm suppliers. Their core technologies and material properties directly determine the imaging accuracy and intelligence level of the system; the midstream is system integrators and equipment manufacturers, responsible for software and hardware integration, image recognition algorithm development and productization; the downstream is widely used in pharmaceutical research and development, biotechnology, food safety testing, disease control centers, environmental monitoring and agricultural microorganisms. With the development of high-throughput screening and synthetic biology, the downstream demand for automated and intelligent colony analysis continues to grow, driving the industry chain to upgrade towards higher precision, faster speed and stronger data analysis capabilities. In 2024, the global

production of microbial colony screening systems will reach 856 units, with an average selling price of US\$100,000 per unit, a single-line production capacity of 50 units, and a gross profit margin of 37%.

The global Microbial Colony Screening System market size was estimated at USD 85.63 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
