Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Microbial Polysaccharides for Pharmaceutical competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Microbial polysaccharides for pharmaceutical refer to polysaccharides produced by bacteria, yeasts or filamentous fungi via controlled fermentation and subsequently purified to pharmaceutical or medical-device grade, where they are used as excipients, biomaterials or active ingredients in human and veterinary medicines. Typical examples include xanthan gum, gellan gum, dextran, pullulan and related microbial exopolysaccharides. Upstream, these materials rely on fermentation substrates (starch hydrolysates, glucose, sucrose), nitrogen sources (corn steep liquor, ammonium salts, yeast extract), process aids and selected high-yield microbial strains. Downstream, pharmaceutical-grade microbial polysaccharides flow into: parenteral products, solid and liquid dosage forms, biomedical materials. In 2024, global sales of microbial polysaccharides for pharmaceutical reached approximately 23 K tons, with an average global market price of around US\$8,767/ton. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 30% to 60%. In pharmaceutical and biomedical fields, the strategic relevance of microbial polysaccharides is becoming more pronounced. Numerous studies indicate that exopolysaccharides exhibit excellent biocompatibility and degradability, together with a wide range of bioactivities such as immunomodulation, antioxidant effects and promotion of tissue repair, which gives them clear advantages in drug-controlled-release matrices, tissue-engineering scaffolds, wound dressings, cell encapsulation and three-dimensional culture systems. As demand rises for advanced formulations, regenerative medicine and precision therapies, high-purity grades of dextran, xanthan gum, pullulan and modified EPS are progressively penetrating high-

value medical and health-care applications, becoming a key driver for the industry's move up the value chain. At the same time, the market still faces several structural challenges and directions for evolution. On one hand, compared with starch-based and some synthetic polymers, microbial polysaccharides typically require longer fermentation cycles and more complex downstream purification, which makes certain products relatively cost-sensitive in bulk industrial uses; this is pushing producers to raise volumetric productivity, valorize by-products and adopt lower-cost carbon sources in order to relieve cost pressure. On the other hand, tightening environmental and regulatory expectations are encouraging companies to reinforce their sustainability strategies, including the use of agricultural residues or by-products as substrates, reduction of organic-solvent usage, and development of polysaccharide-based materials that are easier to recycle and biodegrade. Overall, microbial polysaccharides are expected to evolve along a path of 'structure designability' 'application specialization' 'green production', with the market structure gradually stabilizing into a balance between integrated leaders and specialized players focused on narrow but high-value niches.

The global Microbial Polysaccharides for Pharmaceutical market size was estimated at USD 202.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
