Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Microcellular Polyurethane Jounce Bumper competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Microcellular polyurethane jounce bumper have the advantages of good elasticity, large deformation, and the ability to absorb large impact and vibration energy. Due to the excellent damping performance of this material, it has been widely used in the field of automotive manufacturing. When the microcellular polyurethane jounce bumper is subjected to force, it deforms. When the force changes, the microcellular polyurethane jounce bumper will undergo different deformations with the change of force. After the force disappears, the microcellular polyurethane jounce bumper on its own elasticity to restore its shape, thus playing a role in absorbing vibration. In product design, density is one of the important reference indicators. For example, when used for car shock absorption, microcellular polyurethane jounce bumper can absorb the vibration caused by car bumps and improve driving comfort; If the density of the microcellular polyurethane jounce bumper is small, the deformation generated when subjected to force will be large, the absorbed vibration will be more, and the comfort of the vehicle will be high. However, if the buffer block is subjected to excessive force but the density of the buffer block is not large enough, the buffer block can easily reach the deformation limit and cannot absorb more vibration, which is equivalent to buffer failure. The traditional microcellular polyurethane jounce bumper is a one-piece structure produced through molds, and the density of the buffer block product is consistent from the top to the bottom of the structure. However, in product design, a single density buffer block often cannot meet the requirements. Therefore, a commonly used solution derived from this is to change the external shape of the product; However, the method of changing the shape has limitations and cannot meet

the increasing performance requirements. Therefore, a solution has emerged by adding plastic reinforcement rings outside the buffer block to improve local material rigidity. However, adding reinforcement rings to solve the problem also brings other problems, such as increased process difficulty, difficult assembly of reinforcement rings, easy breakage of buffer stop blocks, and plastic ring breakage. In 2024, global Microcellular Polyurethane Jounce Bumper production reached approximately 303.56 M units, with an average global market price of around US\$ 6.95 per unit.

The global Microcellular Polyurethane Jounce Bumper market size was estimated at USD 2068.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
