### Report Overview

Micro-channel cooling is commonly achieved with the aid of a heat sink consisting of a high conductivity substrate that contains a large number of parallel, small diameter channels. These heat sinks are very compact and lightweight, and by allowing the coolant to undergo phase change (boiling) along the channels, they provide heat transfer coefficients far greater than those possible with single-phase liquid counterparts. They are widely used in Lasers and Optics, Power Electronics and High-Performance Computing etc fields.
