Abstracts

A microchannel plate (MCP) is essentially a fast high-gain amplifier for electrons, having many parallel spatial channels for use in imaging applications. It is directly sensitive not only to input electrons, but also to other charged particles (e.g. ions or elementary particles) and to electromagnetic radiation with sufficiently short wavelength (high photon energy), i.e., from the ultraviolet to soft X-rays. The detection efficiency (quantum efficiency) generally depends on the type and energy of the particles or the photons. For obtaining sensitivity to visible or infrared light, one can use a photocathode in front of the MCP. MCPs are used in various photonic instruments, particularly in image intensifiers and image converters. Besides, they are also applied for the detection of X-rays in Medical Instruments or for industrial inspection. Other application areas are time-of-flight mass spectrometry, nuclear physics, other fundamental physics and electron microscopy. Global core microchannel plate detector manufactures include Hamamatsu Photonics, North Night Vision, Photonis etc. The top 4 companies hold a share about 72%. Asia-Pacific is the largest market, with a share about 43%, followed by Europe and North America with the share about 40% and 13%. In terms of product, circular MCP is the largest segment, with a share over 70%. And in terms of application, the largest application is night vision devices, followed by experimental and nuclear physics and medical instruments.

The global Microchannel Plate Detector market size was estimated at USD 59.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
