Report Overview

Microcristallina Cera is a specific type of wax produced by de-oiling petroleum. It is used in cosmetics and beauty products as a viscosity agent, binder and emollient, and is often considered an alternative to paraffin wax. Unlike paraffin wax, Microcrystalline Wax has fine crystals, and is generally darker, more viscous, denser, tackier and more elastic than paraffin waxes. It has elastic and adhesive characteristics, which are related to its non-straight chain components. Microcrystalline Wax's crystal structure is small and thin, making these waxes more flexible than paraffin wax as well.
