Abstracts

The microcup electrophoretic display module is a module that uses the electrophoresis principle for display. Its characteristic is that it uses a special microcup structure to encapsulate the electrophoretic fluid. The electrophoretic fluid consists of charged particles and insulating solvents. When an electric field is applied, the charged particles migrate under the action of the electric field force, thereby realizing the display of the image. When an electric field is applied between the upper and lower electrodes of the microcup electrophoretic display module, the charged particles migrate under the action of the electric field force. Depending on the direction of the electric field and the properties of the charged particles, the charged particles can move to the top or bottom of the microcup, thereby changing the color distribution in the microcup. By controlling the application and switching of the electric field, dynamic display of the image can be achieved.

The global Microcup Electrophoretic Display Module market size was estimated at USD 376.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
