Report Overview:

Microelectronic solder wire is composed of tin alloy and additives. The alloy components are divided into tin-lead and lead-free additives, which are evenly poured into the middle part of the tin alloy. Different types of solder wire have different auxiliaries. The auxiliary part is to improve the auxiliary heat conduction of the solder wire during the welding process, remove oxidation, reduce the surface tension of the welded material, remove the oil stain on the surface of the welded material, and increase the welding area. The characteristic of solder wire is a tin alloy wire with a certain length and diameter, which can be used in conjunction with an electric soldering iron or a laser in the welding of electronic components.
