## Abstracts

The packaging and paper industry is experiencing significant market penetration for MFC. The use of MFC in paper applications reduces the use of raw materials. Moreover, its bio-degradable nature makes the paper sustainable. MFC replaces conventional filler materials. These factors are driving the growth of MFC Fiber market. MFCs can replace aluminum in packaging applications on back of its barrier properties. Composites include fiber-reinforced materials and organic matrices, with the most commonly used materials being Glass Fiber Reinforced Polymer (GFRP) and Carbon Fiber Reinforced Polymer (CFRP) composites, followed by composites reinforced with aramid or natural fibers. After a decline in production in 2020, the global composites industry is gradually returning to pre-pandemic growth rates, with the energy, electronics/electrical, construction, marine and consumer goods markets showing rapid recovery. New growth opportunities are also emerging in emerging sectors such as electric and hydrogen-fueled vehicles, marine, sports and recreation, medical, electrical and electronics, oil and gas, furniture and design, defense and security, and renewable energy. Between now and the future, composites will provide higher performance, lighter, more energy efficient as well as more durable products in a wider range of applications and markets.

The global Microfibrillated Cellulose Fiber market size was estimated at USD 574.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.90% during the forecast period.
