## Abstracts

A microfiltration system cartridge is a device used for liquid filtration, usually installed in a microfiltration system to remove suspended particles, bacteria, algae and other larger substances in water or other liquids. The pore size of a microfiltration cartridge is usually between 0.1 and 10 microns, which can effectively filter out pollutants larger than the pore size, but allow water molecules and dissolved substances to pass through. The filter element is usually made of materials such as polymers, ceramics, glass fiber or stainless steel, and has high mechanical strength and chemical corrosion resistance. Microfiltration system cartridges are widely used in drinking water treatment, food and beverage industry, pharmaceutical industry, and liquid separation in industrial processes. They can provide efficient and stable filtration effects, help improve liquid quality, and ensure product safety and purity.

The global Microfiltration System Cartridge market size was estimated at USD 577.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
