Report Overview

Microfiltration (MF) is a pressure driven separation process designed to remove selected pollutants, including inorganic, organic or heavy metals (concentration, purification or separation of macromolecules, colloids and suspended particles from solution). This will meet or exceed compliance and / or water recovery targets. The first step is to pretreat the solution, analyze the solution and develop customized chemical treatment process; The second part is to treat the pretreated wastewater through the micro filtration system, and finally clean the membrane. Microfiltration system is widely used in water treatment, whether industrial, commercial or domestic water.
