The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on MicroLED Photoluminescence Inspection System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A MicroLED photoluminescence inspection system is a system that uses short-wavelength lasers to excite the multiple quantum well layers in MicroLED chips to achieve luminescence, and evaluates the quality of LEDs and detects their defects by analyzing the photoluminescence spectrum. Its purpose is to detect wafer-level MicroLED chips before mass transfer, intercept defective points, and improve the yield of MicroLED displays. This system has advantages such as non-contact, non-destructive, and high efficiency. It can quickly and comprehensively detect performance parameters such as the appearance, brightness, and emission wavelength of MicroLEDs on the wafer. It can also accurately evaluate the performance indicators of individual chips by optimizing the inspection process and using machine learning algorithms, effectively eliminate the luminescence interference of adjacent chips, adapt to different sizes and types of chips, and meet the requirements of large-volume and rapid inspection.

The global MicroLED Photoluminescence Inspection System market size was estimated at USD 417.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
