Report Overview:

Micro-needles are new form of dose delivery systems, which can easily overcome various problems associated with the conventional formulations. Microneedle device consists of needles of micron size, which are arranged on a small dermal patch. The main principle of micro-needles include disruption of the skin layer, thus creating micron size pathway for drug delivery, in which the drugs can easily be transferred from epidermis or upper dermis region directly to the systemic circulation without facing any barrier. Micro-needles are of various types such as dissolving micro-needles, coated micro-needles, hollow micro-needles, and fabricated like solid micro-needles.
