Abstracts

Microphone array telescopes are imaging device used to locate sound sources and to characterize them. It consists of a group of microphones that are simultaneously acquired to form a representation of the location of the sound sources. With this method the sound signal is shown and also a sequence of acoustic images can be acquired as acoustic videos are generated at same time. Acoustic telescopes enable the user to visualise different sound sources at different frequencies and source strengths. The resolution and ability to resolve sound sources spaced closely apart, and at lower frequencies, is mainly decided by overall size and number of microphones of the equipment being used. Growing use of 2D acoustic cameras and 3D acoustic cameras across numerous industries will drive the global market. Acoustic cameras are increasingly used to enhance the noise emissions of vehicles, wind turbines, trains and heavy machinery. Advances in the automotive industry and the development of electric and autonomous vehicles have made reducing noise emissions very important for automakers. So they're using technologies like acoustic cameras. Subsequent implementation of stringent regulations by governments and other regulatory agencies aimed at reducing noise pollution from vehicles will affect the sales of acoustic cameras. Increasing adoption of acoustic cameras in the manufacturing industry will boost the market. By using an acoustic camera, users can easily find out why their products are making noise. This will allow them to modify the design of the product. In the industrial field, acoustic cameras can detect leaks in compressed air systems, vacuum leaks, mechanical troubleshooting and electrical partial discharges. If these flaws go undetected, they can spell trouble and increase downtime. Growing focus on ensuring safe and efficient performance of machines across various industries will boost the market.
