### Report Overview:

Microporous insulation is silica based material in the form of compacted powder or fibers with an average interconnecting pore size comparable to or below the mean free path of air molecules at standard atmospheric pressure. Microporous insulation may contain opacifiers to reduce the amount of radiant heat transmitted. This composition results in a material with exceptionally low thermal conductivity (lower than dormant air). Each board is individually encapsulated in polyethylene foil to make it resistant to moisture. It is also available in a flexible form with or without cloth encapsulation.

The Global Microporous Silica Insulating Board Market Size was estimated at USD 452.45 million in 2023 and is projected to reach USD 645.45 million by 2029, exhibiting a CAGR of 6.10% during the forecast period.
