Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Microporous Zeolites competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global microporous zeolite production reached 400,000 tons, with an average global price of \$990 per ton in 2024. Microporous zeolites are a class of aluminosilicate crystalline materials with a regular three-dimensional microporous structure. Their framework consists of [SiO₄] and [AlO₄] tetrahedra that share oxygen atoms, connected by oxygen bridges to form an open framework. According to the International Union of Pure and Applied Chemistry (IUPAC) classification, their pore systems typically have diameters less than 2 nm (classifying them as microporous materials) and exhibit a regular one-, two-, or three-dimensional intersecting pore structure. Because the aluminum oxide tetrahedra carry negative charges, these materials exhibit ion exchange properties by balancing cations (such as Na⁺ and Ca²⁺). Furthermore, their pore size matches the molecular dynamics diameter, endowing them with molecular sieving effects and shape-selective catalytic properties.

The global Microporous Zeolites market size was estimated at USD 398.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
