## Abstracts

A microprocessor ventilator is a sophisticated medical device designed to provide mechanical ventilation support to patients who are unable to breathe adequately on their own, utilizing an integrated microprocessor to precisely monitor and control parameters such as tidal volume, respiratory rate, oxygen concentration, pressure, and flow. These devices are equipped with advanced algorithms and sensors that enable real-time adjustments based on patient needs, ensuring optimal gas exchange and minimizing the risk of complications such as barotrauma or volutrauma. Key features often include multiple ventilation modes?such as volume-controlled, pressure-controlled, and adaptive support modes?touchscreen interfaces for ease of use, data logging capabilities, and connectivity options for integration into hospital information systems, making them essential in intensive care units, emergency departments, and long-term respiratory care settings.
