Abstracts

Microsphere preparation refers to the manufacturing process of creating microscopic spherical particles, typically ranging from 1 to 1000 micrometers in diameter, which are engineered for controlled drug delivery, diagnostics, tissue engineering, or other biomedical and industrial applications. These particles can be composed of various biodegradable or non-biodegradable polymers, lipids, or ceramics and are designed to encapsulate active pharmaceutical ingredients (APIs), contrast agents, or other functional compounds, allowing for sustained release, targeted delivery, or improved stability of the encapsulated substance. The preparation techniques vary widely, including emulsion-solvent evaporation, spray drying, coacervation, and microfluidics, each selected based on the desired particle size, encapsulation efficiency, release profile, and scalability requirements.

The global Microsphere Preparation market size was estimated at USD 350.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
