Abstracts

Microwave absorber foam is a specialized material engineered to attenuate and dissipate electromagnetic radiation, particularly within the microwave frequency range, by converting incident energy into heat through dielectric or magnetic loss mechanisms. Typically composed of polymer matrices?such as polyurethane or silicone?infused with conductive or magnetic fillers like carbon black, ferrites, or carbonyl iron, these foams exhibit tailored impedance matching to minimize reflection and maximize absorption across targeted bandwidths. Their cellular structure enhances performance by increasing the effective path length for wave penetration and dissipation, making them essential in applications requiring electromagnetic interference (EMI) suppression, radar cross-section reduction, and anechoic chamber lining.

The global Microwave Absorber Foam market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
