Report Overview

Microwave backhaul refers to the transportation of traffic (voice, video and data) between distributed sites and a more centralised point of presence via a radio link. Operators can lease microwave spectrum and build networks that deliver several E1/T1s, STM1/OC3s and Ethernet services over the air, providing an instant, reliable and relatively low-cost solution to the growing global demand for backhaul capacity. Microwave is already the backhaul technology used by most mobile operators worldwide, and outside the US nearly 70% of backhaul traffic travels over microwave links. This trend is likely to continue since microwave is a scalable and economical backhaul option compared to leased line copper and new fibre.
