Abstracts

Microwave coaxial cables have a central conductor, usually made of copper, which carries the RF signal. This conductor is surrounded by an insulating material, a metallic shield, and often another insulating layer. The metallic shield provides protection against interference from external sources and also prevents signal loss due to capacitance. In microwave communication systems, coaxial cables are used to connect microwave transmitters and receivers to the antennas. They are chosen for this purpose due to their ability to maintain the integrity of the RF signal over long distances with minimal loss. The quality of the coaxial cable, measured in terms of its shielding effectiveness, frequency range, and attenuation, is crucial for the performance of the microwave system. Microwave coaxial cable frequency range: Microwave generally refers to the frequency range of 300 MHz to 300 GHz, although practical applications are mainly concentrated between 1 GHz and 100 GHz.

The global Microwave Coax Cable market size was estimated at USD 462.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
