Report Overview

A mid-drive e-bike is an electric bicycle where the motor is located in the middle of the bike's frame, usually integrated with the bottom bracket and crankset. This central placement provides several advantages over other types of e-bike motors, like hub motors. The motor's central position offers a more balanced weight distribution, leading to improved handling and stability. Mid-drive motors work with the bike's existing gears, allowing for more efficient power usage. This means better performance on hills and varied terrains since the motor can adjust its output based on the selected gear. Mid-drive electric bikes have surged in popularity among cyclists who face challenging terrains, especially steep inclines. Renowned for delivering more than twice the torque compared to traditional hub motors, these bikes have become a favorite for riders residing in hilly or mountainous regions.

The global Mid-Drive E-Bike market size was estimated at USD 5486 million in 2023 and is projected to reach USD 8437.92 million by 2032, exhibiting a CAGR of 4.90% during the forecast period.

North America Mid-Drive E-Bike market size was estimated at USD 1552.09 million in 2023, at a CAGR of 4.20% during the forecast period of 2024 through 2032.
