Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Mid-to-high-end MLCC Release Films competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. MLCC is a high-end application field for release films, and the technical barriers are high. MLCC increases the capacitance by reducing the thickness of the dielectric layer or increasing the number of MLCC stacking layers. Under the trend of high capacitance, Japanese suppliers such as Murata and Taiyo Yuden generally achieve more than 1,000 stacking layers of 1 μ m thin film dielectrics, Samsung can achieve 600-layer processes, and domestic manufacturers generally have 300 to 500 layers. In order to ensure the thin film and thickness uniformity of the ceramic diaphragm, the formation of each layer of ceramic dielectric requires the same release film. Therefore, the MLCC release film has high requirements for surface smoothness (the bumps are often controlled within 0.2 microns), and it becomes increasingly stringent with the increase in the number of layers and the trend of miniaturization. In addition, the requirements for material matching, surface tension matching, stability of release force, thickness uniformity, etc. are extremely high, and the technical barriers are high. Release films are roughly divided according to the thickness of MLCC casting: those below 3 μ m are high-end, 3-5 μ m are mid-end, 5-8 are mid-to-low-end, and those above 8 μ m are low-end.

The global Mid-to-high-end MLCC Release Films market size was estimated at USD 1918.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
