## Abstracts

A mid-urethral sling (MUS) is a surgical procedure used to treat stress urinary incontinence (SUI) in women. SUI is a condition where physical activities, such as coughing, sneezing, or exercise, cause involuntary leakage of urine due to weakened pelvic floor muscles. The mid-urethral sling procedure involves placing a narrow strip of synthetic mesh under the mid-portion of the urethra to provide support and prevent urine leakage. The sling acts like a hammock, maintaining the urethra in its correct position and preventing involuntary urine loss during activities that increase abdominal pressure. There are different types of mid-urethral slings, such as the transobturator and retropubic approaches, each varying slightly in the placement technique. This procedure is minimally invasive, generally effective, and associated with a high success rate, offering significant improvement in the quality of life for many women with SUI.

The global Mid Urethral Sling (MUS) market size was estimated at USD 665.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
