Report Overview

A middle ear hearing implant is a small device designed for people suffering from a mild-moderate mix or sensorineural hearing loss and conductive hearing loss. It is inserted into the middle ear for aiding in hearing. It is also recommended in eardrum allergies, skin problems, ear infections, collapsed or closed ear canals, etc. conditions. The difference between middle ear implant and other hearing aid is that it does not require a speaker. Middle ear implant transmits sound to the middle ear through the microphone placed behind the ear. The microphone converts sound to mechanical vibration and are sent to a floating mass transducer placed in the middle ear.
