Abstracts

Electro-optics are largely used for military applications on different platforms. These systems include both visible and IR sensors and provide situational awareness in both, day and night time. These systems are largely utilized by military forces for imaging, targeting, and surveillance applications and improve situational awareness during day-night, and low-light conditions. Image stabilization and long-range imaging capabilities are two key elements of these systems. These systems are usually installed on military vehicles, aircraft, ships, and UAVs and their usage is primarily focused on target recognition, tracking mobile targets, surveillance, and imaging, even over great distances and in adverse weather conditions. These advanced systems provide the advantage of stabilized panoramic viewing and targeting. The platform remains one of the key application areas of electro-optics as a whole and captures over 40% of the total electro-optical system market. The military platform optoelectronic system is a comprehensive system that integrates various technologies such as photoelectric detection, signal processing, and data transmission, and is mainly used for reconnaissance, surveillance, target tracking, and strike tasks in the military field. The optoelectronic system of a military platform is usually composed of multiple subsystems, including a photodetector, a signal processing unit, a data transmission unit, etc. Among them, the photodetector is the core of the whole system, which can receive signals such as optical radiation or thermal radiation from the target, convert them into electrical signals, and then carry out further processing and analysis through the signal processing unit. The advantages of the military platform optoelectronic system lie in its high precision, high resolution and high reliability, which can quickly and accurately identify and track targets in complex environments, providing important information support for military operations. In addition, the military platform optoelectronic system also has the advantages of small size, light weight, strong anti-jamming ability, etc., and can adapt to different military needs and battlefield environments.

The global Military Platform Electro-Optics market size was estimated at USD 781.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
