Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Millimeter Wave (MmWave) Beamforming IC competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A Millimeter Wave (MmWave) Beamforming IC is an integrated circuit specifically designed to operate in the millimeter wave frequency range, typically spanning from 30 GHz to 300 GHz. It is engineered to manipulate and control the direction and intensity of electromagnetic waves transmitted or received by an antenna array. Through a process called beamforming, the IC adjusts the phase and amplitude of the signals sent to or received from each individual antenna element within the array. This enables the creation of a focused beam of electromagnetic energy that can be steered in different directions, enhancing the signal strength in the desired direction while reducing interference and signal loss in other directions. MmWave Beamforming ICs are crucial components in modern wireless communication systems, such as 5G and beyond, where they help improve data rates, increase network capacity, and enable reliable communication over relatively short distances by compensating for the higher propagation losses associated with millimeter wave frequencies. They are also used in applications like radar systems, automotive sensing, and satellite communications, providing precise control over the electromagnetic wave propagation for better performance and functionality.

The global Millimeter Wave (MmWave) Beamforming IC market size was estimated at USD 358.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
