Abstracts

Millimeter wave scanners are non-invasive security screening systems that utilize high-frequency electromagnetic waves in the 30-300 GHz range to create high-resolution, three-dimensional images of objects concealed beneath clothing, making them particularly valuable for detecting metallic and non-metallic threats such as weapons, explosives, or contraband without physical contact. These scanners are widely deployed in high-security environments like airports, government facilities, correctional institutions, and large public venues, where they enhance security protocols by providing detailed imagery while prioritizing privacy through automated target recognition software that anonymizes sensitive anatomical details. The technology operates by emitting low-power millimeter waves that reflect off the body and objects, with advanced algorithms processing the differential reflections to generate a detailed outline of hidden items, offering a balance between effective threat detection and respect for individual privacy.

The global Millimeter Wave Scanner market size was estimated at USD 103.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
