Abstracts

Milnacipran hydrochloride is a serotonin/norepinephrine reuptake inhibitor (SNRI) primarily indicated for the management of fibromyalgia, a chronic condition characterized by widespread pain, fatigue, and cognitive disturbances. It functions by increasing the levels of serotonin and norepinephrine in the central nervous system, which helps modulate pain perception and improve physical function in affected patients. Unlike some other antidepressants in its class, milnacipran exhibits a relatively balanced affinity for inhibiting the reuptake of both neurotransmitters, contributing to its specific therapeutic profile. As a prescription medication, it is subject to stringent regulatory oversight and is typically used when first-line treatments prove inadequate, positioning it within the niche segment of central nervous system drugs targeting chronic pain disorders.

The global Milnacipran Hydrochloride market size was estimated at USD 215.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
