Abstracts

Mine Survey Software is a specialized digital tool designed for mine resource exploration, mining planning, and production monitoring. Its core function is to integrate geographic information, geological data, and engineering technologies to enable digital and precise management of the entire mine survey process. Leveraging GIS, remote sensing, 3D modeling, and data analysis, it collects, processes, and visualizes data on the topography, geological structure, and mineral resource distribution of a mining area. For example, it can generate a 3D mine terrain model by importing drone aerial data or integrate geological drilling data to annotate ore body boundaries and grade distribution. In practical applications, the software assists with key tasks such as resource reserve estimation, mining area delineation, and exploration route planning. It also monitors topographic changes and resource consumption in real time during mining operations, providing mining companies with scientific exploration plans and a basis for mining decision-making. This effectively reduces survey errors, improves work efficiency, and ensures the safety and sustainability of mine resource development. It is a core supporting tool for the transition of modern mine survey from traditional manual methods to intelligent and information-based methods.

The global Mine Survey Software market size was estimated at USD 245.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
