Mineral Liberation Analysis (MLA) is a sophisticated technique used to study and quantify the liberation characteristics of minerals in ores and concentrates. The MLA system uses automated scanning electron microscopy (SEM) to generate high-resolution images of mineral samples, allowing for the precise identification and analysis of mineral grains. By providing detailed information about the mineralogical composition, grain size distribution, and the extent of mineral liberation, MLA helps optimize the processing and recovery of valuable minerals during beneficiation. This system is commonly employed in the mining and metallurgical industries to improve ore processing efficiency, increase recovery rates, and reduce energy and resource consumption. The MLA system plays a crucial role in advancing the understanding of mineral behavior, leading to more effective and sustainable mining practices.

The global Mineral Liberation Analysis (MLA) System market size was estimated at USD 244.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
