Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Mineral Slice Composite Sheet Matrix competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The ore sheet composite substrate is an ultra-hard composite material substrate manufactured using powder metallurgy technology. It typically consists of a tungsten carbide skeleton and a metal binder such as cobalt or nickel, sintered under high temperature and high pressure. Serving as a support for diamond or cubic boron nitride composites, it provides a high-strength, high-toughness, and excellent thermal conductivity for the polycrystalline superhard layer. It is widely used in oil drill bits, mining tools, and other applications requiring resistance to harsh wear and impact conditions. The upstream supply chain for ore sheet composite substrates consists of suppliers of ultra-hard micropowders and metal powders. The midstream involves high-temperature and high-pressure sintering and precision machining processes with extremely high technical barriers. The downstream supply chain strictly supports the needs of oil and gas drilling and mining machinery manufacturing. Global annual production capacity is limited by cutting-edge equipment and processes, typically requiring high technical barriers and medium-volume production. Production capacity reaches hundreds of thousands of sheets. Due to its strong technological monopoly and the direct impact of its products on mining efficiency, its gross profit margin is at the high end of the industrial material spectrum, expected to remain between 40% and 60%. In 2024, the output of mineral sheet composite sheet matrix was approximately 730,000 pieces, with an average global market price of approximately US\$250 per piece. The market for composite sheet substrates is being driven by the dual forces of global energy resource exploration and development, as well as continued investment in infrastructure projects. Its prospects are deeply tied to the demands of deep-earth

mining technology and hard rock tunneling, placing extreme demands on the substrate's wear and impact resistance. The European market, leveraging its deep materials science expertise and leading equipment manufacturers, continues to lead the way in high-end formulation and process innovation. The North American market, driven by its vibrant shale oil and gas drilling and mining operations, maintains a stable demand for high-reliability products. The Asia-Pacific market, particularly China, demonstrates the strongest growth potential, leveraging its position as the world's largest manufacturing industry and its complementary industrial chain, and is rapidly becoming a core global R&D and manufacturing base.

The global Mineral Slice Composite Sheet Matrix market size was estimated at USD 182.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
