## Abstracts

A micro proximity sensor is a small, highly sensitive sensor that is mainly used to detect the proximity or displacement change of an object. It achieves non-contact measurement through electromagnetic fields, electrostatic fields, or induction principles. When the target object approaches the sensor, it causes a signal change inside the sensor, resulting in a response. This type of sensor is widely used in fields such as automated control, robotics, smart devices, and precision instruments. Due to its compact design, it is suitable for installation in places with limited space and can detect objects efficiently and quickly.

The global Miniature Proximity Sensor market size was estimated at USD 2908.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
