## Abstracts

Miniaturized three-photon microscopy is a high-resolution imaging technology that can perform non-invasive observations at deeper tissue levels based on the principle of three-photon absorption. Compared with traditional single-photon and two-photon microscopy, three-photon microscopy can utilize longer wavelength laser light sources and reduce tissue scattering, thereby achieving deeper imaging. Miniaturized three-photon microscopy uses technological innovation to make this imaging system more compact and portable. It is widely used in biomedical research, especially in neuroscience and in vivo imaging, to observe cells, molecular dynamics and tissue structures in living animals.

The global Miniaturized Three-Photon Microscope market size was estimated at USD 352.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
