Report Overview

Minimally Invasive Glaucoma Surgery (MIGS) devices are specialized medical implants and instruments designed to reduce intraocular pressure (IOP) in glaucoma patients through procedures that are less traumatic than traditional surgeries like trabeculectomy or tube shunts. MIGS devices typically target the conventional outflow pathway (e.g., trabecular meshwork) or create alternative drainage routes (e.g., suprachoroidal or subconjunctival spaces) while minimizing tissue disruption, resulting in faster recovery, fewer complications, and suitability for mild-to-moderate glaucoma cases. These devices include stents (e.g., iStent, Hydrus), micro-bypass shunts, and ab interno gelatin stents (e.g., Xen), often used in conjunction with cataract surgery. Their adoption is driven by the growing demand for safer, effective, and early-intervention solutions in glaucoma management, particularly in aging populations with a high prevalence of ocular comorbidities.

The global Minimally Invasive Glaucoma Surgery MIGS Devices market size was estimated at USD 609.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.42% during the forecast period.
