## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Mining Defoamers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Mining defoamers are chemical additives specifically used in slurry flotation, hydrometallurgy, and mineral processing. They effectively suppress or eliminate stable foam generated by agitation, aeration, and reagent reactions, improving slurry fluidity, flotation efficiency, and equipment utilization. Typically composed of silicone, polyether, or composite nonionic surfactants, these defoamers offer high-temperature resistance, strong acid and alkali resistance, rapid foam breakdown, and long-lasting foam suppression. They prevent metal loss, pipeline blockage, and production safety hazards caused by foam overflow. They are widely used in the beneficiation processes of copper, gold, iron, and bauxite, and are crucial additives for ensuring continuous, efficient, and stable mine operations. In 2024, the global production of mining defoamers will reach 390,310 tons, with an average selling price of US\$950/ton.

The global Mining Defoamers market size was estimated at USD 371.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
